

Aspects of the “Smith is Huq” condition

Tim Van der Linden

Abstract. We give a survey of the so-called *Smith is Huq* property for semi-abelian (or finitely cocomplete homological) categories. We recall its history and basic motivations and the fundamental definitions and results [1, 4, 5, 7]. We then have a look at some new examples, characterisations and applications [2, 3, 6].
